

ABSTRACT

A fuse device includes a base, two conductor blades secured to the base and extended outward of the base and each having a groove formed between two ears.

05 A fuse member has two ends engaged into the grooves of the conductor blades. The conductor extensions include a non-circular cross section for securing or plugging or attaching to the other sockets or objects. The conductor blades each includes an opening communicating

10 with the grooves for receiving the ends of the fuse member. A cover is secured to the base for shielding the fuse member and the conductor blades.
